CWP

INTRODUCTION

It is proposed to construct a mixed use development on two parcels of land on the north and south sides of Meadow Road, east of US Route 1 in the Township of West Windsor, Mercer County, New Jersey, see Figure 1 in Appendix A. Specifically, the development will consist of the following (The Project):

- North of Meadow Road (North Parcel)
 - 130 Room Hotel
 - 6,915 Square Foot Restaurant
 - 16,000 Square Feet of Retail Space
 - 356 Multi-Family Residential Units
- South of Meadow Road (South Parcel)
 - 300 Multi-Family Residential Units

The north parcel is designated as Block 9 – Lot 12.01 and the south parcel is designated as Block 9.03 – Lot 12.02 on the Township of West Windsor Tax Maps. Block 9 – Lot 12.03 is also included as part of the subject property but will remain undeveloped as it is within a recorded “greenbelt”. The two (2) parcels that will be developed are currently vacant. The site is located within the PNM-1 – Planned Mixed Use Neighborhood Zone. Access to the north parcel is proposed via two (2) full –movement driveways along Carnegie Center Drive and one (1) full-movement driveway along Meadow Road. Access to the south parcel is proposed via Meadow Road, opposite Meadow Road Connector by creating a new roundabout intersection, as well as via one (1) full-movement driveway along Old Meadow Road.

Dynamic Traffic LLC has been retained to prepare this study to assess the traffic impact associated with the construction of The Project on the adjacent roadway network. This study documents the methodology, analyses, findings and conclusions of our study and includes:

- A detailed field inspection was conducted to obtain an inventory of existing roadway geometry, traffic control, and location and geometry of existing driveways and intersections.
- Existing traffic data was collected via manual turning movement (MTM) counts during the weekday AM and weekday PM peak periods at the intersections of:
 - Meadow Road and the US Route 1 SB Ramps
 - Meadow Road, Old Meadow Road and the US Route 1 NB Ramps
 - Meadow Road and Meadow Road Connector
 - Meadow Road and Bear Brook Road
 - Meadow Road Connector and Carnegie Center Drive
 - Carnegie Center Drive and three (3) existing office driveways
 - Old Meadow Road and “The Square at West Windsor” shopping center driveway
- Automatic traffic recorder (ATR) counts were performed along Carnegie Center Drive and the US Route 1 NB Ramp for a period of seven (7) days.

- Projections of traffic to be generated by the proposed development were prepared utilizing trip generation data as published by the Institute of Transportation Engineers. Site traffic was then assigned to the adjacent street system based upon the anticipated directional distribution.
- Capacity analyses were conducted for the Existing, No Build, and Build conditions for the study intersections.
- The proposed points of ingress and egress were inspected for adequacy of geometric design, spacing and/or alignment to streets and driveways on the opposite side of the street, relationship to other driveways adjacent to the development, and conformance with accepted design standards.
- The site plan as designed was reviewed for sufficiency in accommodating large wheel base vehicles such as delivery trucks, refuse trucks, and emergency vehicles.
- The parking layout and supply was assessed based on accepted design standards, local requirements, and demand experienced at similar developments.

EXISTING CONDITIONS

A review of the existing roadway conditions near the proposed site was conducted to provide the basis for assessing the traffic impact of the development. This included field investigations of the surrounding roadways and intersections, collection of traffic volume data, and extensive analyses.

Existing Roadway Conditions

The following are descriptions of the roadways in the study area:

Meadow Road is an Urban Major Collector roadway under municipal jurisdiction with a general east/west orientation. In the vicinity of the site the posted speed limit is 25 MPH and the roadway provides one travel lane in each direction to the east and two (2) travel lanes in each direction to the west. On-street parking is not permitted and there is no curb or sidewalk along either side of the roadway. Meadow Road provides a relatively flat vertical alignment and a curved horizontal alignment along the site frontages. West of the site exists an interchange where Meadow Road traverses over US Route 1 before its westerly terminus at Canal Pointe Boulevard.

Meadow Road Connector is an Urban Major Collector roadway under municipal jurisdiction with a general north/south orientation. The roadway extends for approximately 500' between its intersections with Meadow Road and Carnegie Center Drive. Two lanes of travel are provided in each direction and there is no curb or sidewalk along either side of the roadway. The regulatory speed limit is 25 MPH.

Old Meadow Road is a local roadway under municipal jurisdiction providing one lane for each direction of travel. The roadway extends approximately 2,000 feet from its intersection with Meadow Road, opposite the US Route 1 NB Ramps to its easterly terminus as a dead end roadway. Emergency access is provided from its easterly terminus to Meadow Road. Old Meadow Road serves as an access roadway to multiple developments to the south including "The Square at West Windsor" shopping center and the "Windsor Woods" residential development. Sidewalk is provided along the southerly side of the roadway and curb is provided for portions of the southerly side of the roadway. No curb or sidewalk is provided along the northerly side of the roadway.

Carnegie Center Drive is an Urban Major Collector roadway along the site frontage and is under municipal jurisdiction. The roadway serves as a "ring road" around a large office complex. In the vicinity of the site the posted speed limit is 25 MPH and the roadway provides one travel lane and one bike lane in each direction. On-street parking is not permitted. Curb is provided only along the north side of the roadway and sidewalk is not provided on either side of the roadway. Left-turn lanes are provided at driveways for the adjacent office buildings to the north.

Bear Brook Road is an Urban Minor Collector roadway under municipal jurisdiction with a general north/south orientation. In the vicinity of Meadow Road, the posted speed limit is 25 MPH and the roadway provides one travel lane in each direction separated by a grass median. On-street parking is not permitted and curb and sidewalk are provided along the east side of the roadway. The land uses along Bear Brook Road are primarily residential. The roadway provides access from Meadow Road to the south to Alexander Road to the north.

Existing Traffic Volumes

Manual turning movement (MTM) counts were conducted on Thursday, May 9, 2019 from 7:00 to 9:00 AM and from 4:30 to 6:30 PM at the following intersections:

- Meadow Road and the US Route 1 SB Ramps
- Meadow Road, Old Meadow Road and the US Route 1 NB Ramps
- Meadow Road and Meadow Road Connector
- Meadow Road and Bear Brook Road
- Meadow Road Connector and Carnegie Center Drive
- Carnegie Center Drive and three (3) existing office driveways
- Old Meadow Road and “The Square at West Windsor” shopping center driveway

In addition, automatic traffic recorder (ATR) counts were conducted along Carnegie Center Drive and the Route 1 NB ramp from Tuesday, September 17, 2019 to Monday, September 23, 2019.

Review of the collected traffic data reveals that the weekday morning peak street hour (PSH) occurs between 8:00 - 9:00 AM, the weekday evening PSH occurs between 4:45 - 5:45 PM. Where necessary, traffic volumes were balanced between intersections with the higher through volume governing. Figure 2, located in Appendix A, shows the existing peak hour traffic volumes at the study intersections. All traffic counts are contained in Appendix B.

Existing Capacity Analysis

The methodology utilized in the capacity analyses is described in the *Highway Capacity Manual*, published by the Transportation Research Board. In general, the term Level of Service (LOS) is used to provide a “qualitative” evaluation of capacity based upon certain “quantitative” calculations related to empirical values, such as traffic volume and intersection control.

At the signalized intersections, factors that affect the various approach capacities include width of approach, number of lanes, signal “green time”, turning percentages, truck volumes, etc. However, delays cannot be related to capacity in a simple one-to-one fashion. For example, it is possible to have delays in the Level of Service “F” range without exceeding roadway capacity. Substantial delays can exist without exceeding capacity if one or more of the following conditions exist: long signal cycle lengths; a particular traffic movement experiences a long red time; or progressive movement for a particular lane group is poor. Table I describes the level of service ranges for signalized intersections.

An unsignalized (STOP sign controlled) driveway or side street along a through route is seldom critical from an overall capacity standpoint, however, it may be of great significance to the capacity of the minor cross-route, and it may influence the quality of traffic flow on both. When analyzing an unsignalized intersection, it is assumed that both the major street through and right turn movements are unimpeded and have the right-of-way over all side street traffic and left turns from the major street. All other turning movements in the intersection cross, merge with, or are otherwise impeded by major street movements. Traffic delays at unsignalized intersections are determined by sequentially processing these impeded movements. Table II describes the level of service ranges for unsignalized (stop controlled) intersections.

Table I
Level of Service Criteria
for Signalized Intersections

Level of Service	Average Control Delay (seconds per vehicle)
A	0.0 to 10.0
B	10.1 to 20.0
C	20.1 to 35.0
D	35.1 to 55.0
E	55.1 to 80.0
F	greater than 80.0

Table II
Level of Service Criteria
for Unsignalized Intersections

Level of Service	Average Control Delay (seconds per vehicle)
a	0.0 to 10.0
b	10.1 to 15.0
c	15.1 to 25.0
d	25.1 to 35.0
e	35.1 to 50.0
f	greater than 50.0

All capacity analyses were performed utilizing Synchro 10 software. Tables III and IV summarize the existing levels of service (LOS) and delays. All capacity analysis calculation worksheets are contained in Appendix C.

Table III
Existing Levels of Service - Signalized

Signalized Intersection	Direction/ Movement	Morning Peak Hour		Evening Peak Hour

The following are discussions pertaining to each of the existing intersections analyzed. It should be noted that the existing percentage of trucks and peak hour factors were used in the existing analysis.

Meadow Road & Route 1 SB Ramps

Ramps to/from southbound Route 1 intersect Meadow Road from the north to form a three-leg intersection controlled by a traffic signal. The signal timing directive was obtained from the New Jersey Department of Transportation which indicates that the signal operates with three (3) phases including an eastbound left-turn lead phase.

The eastbound Meadow Road approach to the intersection provides an exclusive left-turn lane and a through lane. The westbound Meadow Road approach provides two (2) through lanes and a channelized right turn lane. The southbound approach of the Route 1 southbound off ramp provides a double left-turn lane and an exclusive right-turn lane. A pedestrian crosswalk is provided across the eastbound leg of the intersection.

A review of the existing analysis reveals that movements at the intersection operate at level of service "C" or better during the analyzed peak periods. See Table III for the individual movement levels of service and delays.

Meadow Road, Old Meadow Road & Route 1 NB Ramps

Old Meadow Road intersects Meadow Road from the south, opposite ramps to/from northbound Route 1. The signal timing directive was obtained from the New Jersey Department of Transportation

which indicates that a four phase operation is utilized inclusive of lead left-turn phases for all approaches.

The eastbound Meadow Road approach provides an exclusive left-turn lane, a through lane and a shared through/right-turn lane. The westbound Meadow Road approach provides an exclusive left-turn lane, two through lanes and a channelized right-turn lane. The northbound Old Meadow Road approach to the intersection provides an exclusive left-turn lane and a shared through/right-turn lane. The southbound Route 1 ramp approach to the intersection provides an exclusive left-turn lane, a through lane and a channelized right-turn lane. A pedestrian crosswalk is provided across the eastbound leg of the intersection.

A review of the existing analysis reveals that the intersection operates at overall level of service "B" or better and all movements operate at levels of service "D" or better during the analyzed peak periods with the exception of the southbound left-turn movement which operates at level of service "E" during the weekday evening peak hour. See Table III for the individual movement levels of service and delays.

Meadow Road & Bear Brook Road

Bear Brook Road intersects Meadow Road from the north to form a three-leg intersection controlled by a traffic signal. The signal timing directive indicates that a two-phase operation is utilized inclusive of a right-turn overlap phase for westbound Meadow Road.

The eastbound Meadow Road approach includes an exclusive left-turn lane, a through lane and a bike lane. The westbound Meadow Road approach includes a through lane, a bike lane and an exclusive right-turn lane. The southbound Bear Brook Road approach includes separate left-turn and right-turn lanes. Pedestrian crosswalks are provided across the eastbound and southbound approaches to the intersection.

A review of the existing analysis reveals that movements at the intersection operate at level of service "C" or better during the analyzed peak periods. See Table III for the individual movement levels of service and delays.

Route 1 NB Ramp & Carnegie Center Drive

A ramp from northbound Route 1 merges with Carnegie Center Drive in the northwest corner of the north parcel. This intersection was conservatively analyzed as a two-way stop controlled intersection although movements from Route 1 are yield controlled.

A review of the existing analysis reveals that the intersection operates at level of service "B" or better during the analyzed peak periods. See Table IV for the individual movement levels of service and delays.

Meadow Road & Meadow Road Connector

Meadow Road Connector intersects Meadow Road from the north to form a three-leg intersection controlled by a STOP sign on the Meadow Road Connector. The eastbound Meadow Road approach includes an exclusive left-turn lane, a through lane and a bike lane. The westbound Meadow Road

approach includes a through lane, a bike lane and an exclusive right-turn lane. The southbound Meadow Road Connector approach includes separate left-turn and right-turn lanes.

A review of the existing analysis reveals that all movements operate at levels of service "D" or better during the analyzed peak periods with the exception of the southbound left-turn movement which operates at level of service "F" during the weekday evening peak hour, likely a result of the volume of traffic exiting the office complex at the end of the work day. See Table IV for the individual movement levels of service and delays.

Meadow Road Connector & Carnegie Center Drive

Carnegie Center Drive intersects the Meadow Road Connector from the west to form a three-leg intersection controlled by a STOP sign on the eastbound Carnegie Center Drive approach. It is noted that the southbound approach or, northerly leg of the intersection, is considered Carnegie Center Drive although it is physically a continuation of Meadow Road Connector.

A review of the existing analysis reveals that the all movements operate at levels of service "D" or better during the analyzed peak periods. See Table IV for the individual movement levels of service and delays.

Carnegie Center Drive & Office Driveways

The three (3) office driveways studied each intersect Carnegie Center Drive from the north and are all controlled by STOP signs on the respective driveway approaches. A left-turn lane is provided for ingress to each driveway along Carnegie Center Drive and a single lane is provided for egress.

A review of the existing analysis reveals that movements at each driveway operate at levels of service "B" or better during the analyzed peak periods. See Table IV for the individual movement levels of service and delays.

Old Meadow Road & Shopping Center Driveway

A driveway for "The Square at West Windsor" shopping center intersects Old Meadow Road from the south to form a three-leg unsignalized intersection controlled by a STOP sign on the driveway approach to the intersection. The driveway provides separate left and right turn lanes for egress.

A review of the existing analysis reveals that movements at each driveway operate at levels of service "B" or better during the analyzed peak periods. See Table IV for the individual movement levels of service and delays.

FUTURE CONDITIONS

Traffic volumes and operational analyses were developed for both the No Build and Build conditions. The No Build conditions provide a baseline for assessing the impact of the site development traffic on the roadway system. The process of developing the No Build and Build traffic volumes and the subsequent analyses is outlined below.

Regardless of whether the subject site is developed or not, traffic volumes on the surrounding roadways are expected to increase as a result of developments throughout the region. A growth rate for roadways within the study area was obtained from the NJDOT Annual Background Growth Rate Table, which indicates a growth rate of 1.0% per year.

Through consultation with the Township of West Windsor Planning Board staff, there are no other developments in the vicinity of the site that have been approved but not yet constructed that are identified as significant traffic generators. It was assumed that the background growth rate was adequate to account for the traffic associated with all developments not listed.

Future No Build traffic volumes were developed by applying the background growth rate of 1.0% for four (4) years to the study area roadways existing traffic volumes. Figure 3, in Appendix A, shows the No Build traffic volumes.

Traffic Generation

Trip generation projections for The Project were prepared utilizing trip generation research data as published in the Institute of Transportation Engineers' (ITE) publication, *Trip Generation, 10th Edition*. This publication sets forth trip generation rates based on traffic counts conducted at research sites throughout the country. The following Land Use Codes (LUC) and associated independent variables were utilized for the trip generation projections:

- LUC 310 – Hotel – 130 Rooms
- LUC 932 – High-Turnover Sit Down Restaurant – 6,915 Square Feet
- LUC 820 – Shopping Center – 16,000 Square Feet
- LUC 221 – Multi-Family Housing (Mid Rise) – 356 Dwelling Units (North Parcel)
- LUC 221 – Multi-Family Housing (Mid Rise) – 300 Dwelling Units (South Parcel)

It should be noted that the description for LUC 310 indicates that restaurants are included within the trip generation research for some of the hotels that contained an attached or internal restaurant. Therefore, the use of LUC 932 to separately project the restaurant trip generation is somewhat conservative.

The ITE publication *Trip Generation Handbook*, recognizes that when land uses are proximate to each other, individual land uses tend to interact, reducing the overall trip generation for the site. It is anticipated that there will be an overall reduction in site generated trips due to the opportunities for users to visit a combination of the hotel, residential, restaurant and retail uses. These trips can be made without accessing the regional roadway network and are considered "internal" to the overall development. Based on the ITE internal capture methodology, reduction rates of 8.9% and 25.0% have been applied to site generated trips during the weekday morning and weekday evening peak hours, respectively, to account for this effect. All internal capture calculation worksheets are

contained in Appendix D. It should be noted that internally captured traffic volumes associated with the south parcel were considered in the analysis and routed to cross Meadow Road as vehicular trips even though these vehicular trips will likely be frequently replaced with pedestrian trips across Meadow Road.

According to studies conducted by ITE, traffic associated with LUC 820 and LUC 932 is not 100% newly generated. Rather, a portion of the traffic is diverted from the existing traffic stream on the adjacent roadway network. This is because the retail and restaurant uses are not exclusively destination land uses, instead patrons stop on their way to/from other locations such as home or work. ITE identifies a 34% passby traffic percentage for LUC 820 and 43% passby traffic percentage for LUC 932, which are also accepted by NJDOT, and were used during the evening peak hour. It should be noted that there will realistically be passby traffic during the weekday morning peak periods as well even though there is no data published by ITE or NJDOT. However, conservatively, no credit was taken for this effect. Table V below details the traffic volumes associated with the subject project taking into account internal capture and the passby credits. Trip Generation calculations are contained in Appendix D.

Table V
Trip Generation Considering Passby Traffic

Trip Type		AM PSH			PM PSH		
		In	Out	Total	In	Out	Total
Princeton Executive Park	Total	144	237	381	326	249	575
	Internal	17	17	34	72	72	144
	Passby	0	0	0	21	21	42
	New (Primary)	127	220	347	233	156	389

Once the magnitude of traffic to be generated by the site is known, it is necessary to assign that traffic to the adjacent street system. The distribution of new traffic to the surrounding roadways is based on the location of primary arterial roadways, major signalized intersections and existing traffic patterns. Table VI below summarizes the anticipated trip distribution for The Project.

Table VI
Trip Distribution

To/From	Percentage
Route 1 North	54%
Route 1 South	28%
Meadow Road East	10%
Meadow Road West	8%
Total	100%

Located in Appendix A, the following Figures illustrate the site generated traffic volumes;

- Figure 4 – Hotel Site Generated Traffic
- Figure 5 – North Residential Site Generated Traffic
- Figure 6 – South Residential Site Generated Traffic
- Figure 7 – Commercial (Retail/Restaurant) Primary Site Generated Trips
- Figure 8 - Commercial (Retail/Restaurant) Passby Site Generated Trips
- Figure 9 – Total Site Generated Traffic Volumes

The site generated volumes were added to the No Build traffic volumes to generate the Build traffic volumes, which are shown in Figure 10.

Future Capacity Analysis

Operational conditions at the study intersections were analyzed under the No Build and Build conditions and are summarized in Tables VII through X below.

Meadow Road & Route 1 SB Ramps

With the addition of site generated traffic, the intersection is anticipated to operate at overall intersection level of service “A” during the analyzed peak hours. Additionally, each movement is anticipated to operate at acceptable levels of service “D” or better. See Tables VII and IX for the individual movement levels of service and delays.

Meadow Road, Old Meadow Road & Route 1 NB Ramps

With the addition of site generated traffic, the intersection is anticipated to operate at overall intersection level of service “B” or better during the analyzed peak hours. Additionally, each movement is anticipated to operate at levels of service “D” or better. In fact, the additional

southbound traffic generated by the south residential parcel results in more green time given to the north/south signal phase which slightly reduces the delay for the most constrained southbound left-turn movement. Additionally, it should be noted that this intersection will be modified to accommodate a pedestrian crossing of the southbound approach to the intersection which will provide a connection between the north parcel and the sidewalk on the south side of Old Meadow Road which serves the shopping center and adjacent residential development. See Tables VII and IX for the individual movement levels of service and delays.

Meadow Road & Bear Brook Road

With the addition of site generated traffic, the intersection is anticipated to operate at overall intersection level of service "A" during the analyzed peak hours. Additionally, each movement is anticipated to operate at levels of service "C" or better. See Tables VII and IX for the individual movement levels of service and delays.

Route 1 NB Ramp & Carnegie Center Drive

With the addition of site generated traffic, the intersection is anticipated to continue to operate at levels of service "B" or better during the analyzed peak hours. See Tables VIII and X for the individual movement levels of service and delays.

Meadow Road & Meadow Road Connector/South Parcel Driveway

A driveway to the south parcel is proposed as the fourth leg to the Meadow Road Connector intersection with Meadow Road. Additionally, the intersection will be modified to a roundabout intersection with the eastbound, westbound and southbound approaches providing a right-turn lane and a through lane into the interior circulating lane. The northbound driveway approach will provide one lane for all movements.

With the addition of site generated traffic and the improvements described above, movements at the roundabout are anticipated to operate at levels of service "B" or better during the analyzed peak hours. This represents a substantial improvement to the no build condition which results in southbound lefts operating at level of service "F" and southbound right-turn movements operating levels of service "E". See Tables VIII and X for the individual movement levels of service and delays.

Meadow Road Connector & Carnegie Center Drive

With the addition of site generated traffic, movements at the intersection are anticipated to operate at levels of service "D" or better, maintaining the No Build levels of service. See Tables VIII and X for the individual movement levels of service and delays.

Carnegie Center Drive & Office Driveways/North Parcel Driveways

Site driveways for the north parcel are proposed to intersect Carnegie Center Drive opposite the easterly and westerly office driveways. The median will be restriped to provide opposing left-turn lanes along Carnegie Center Drive for left-turn ingress into the respective driveways.

With the addition of site generated traffic and the introduction of site driveways opposite the existing driveways, these intersections are anticipated to operate at favorable levels of service "C" or better.

during the analyzed peak hours. See Tables VIII and X for the individual movement levels of service and delays.

Old Meadow Road & Shopping Center Driveway

With the addition of site generated traffic, movements at the intersection are anticipated to operate at levels of service “B” or better, maintaining the No Build levels of service. See Tables VIII and X for the individual movement levels of service and delays.

Meadow Road and North Parcel Site Driveway

The site driveway is proposed to intersect Meadow Road from the north to form an unsignalized T-intersection with the southbound approach of the site driveway operating under stop control. Meadow Road is proposed to be restriped within its existing cartway to provide an exclusive left-turn lane and two through lanes in the eastbound direction. The westbound approach of Meadow Road is proposed to provide a through lane and a shared through/right turn lane. The site driveway will provide a single lane for all egress movements.

As designed, the driveway is anticipated to operate at levels of service “D” or better during the studied peak hours. See Table X for the individual movement levels of service and delays.

Old Meadow Road and South Parcel Site Driveway

The site driveway is proposed to intersect Old Meadow Road from the north to form an unsignalized T-intersection with the southbound approach of the site driveway operating under stop control. Both Old Meadow Road approaches as well as the site driveway will provide a single lane for all movements.

As designed, the driveway is anticipated to operate with minimal delay at level of service “A” during the studied peak hours. See Table X for the individual movement levels of service and delays.

As described above, under future Build conditions, all movements within the studied roadway network will operate acceptably at levels of service “D” or better during both peak hours analyzed.

SITE PLAN

Site Access and Circulation

The site plan was reviewed with respect to the site access and on-site circulation design. As noted previously, access to the north parcel will be provided via a new full movement driveway along Meadow Road and via two (2) new full-movement driveways along Carnegie Center Drive which are appropriately located aligned with and opposite existing driveways. Access to the south parcel will be proposed via the new roundabout intersection with Meadow Road and via a full-movement driveway along Old Meadow Road. As evidenced based on the capacity analysis results, this access configuration will serve the properties efficiently and will operate safely and within acceptable ranges of delay.

On-site parking and drive aisles have been designed to provide safe and efficient circulation throughout The Project and are supplemented by ample pedestrian and bicycle amenities to serve the residents, guests and patrons. Review of the site plan design indicates that the site can sufficiently accommodate, within paved areas, a large wheel base vehicle where required, along with the passenger vehicle traffic anticipated.

Parking

The parking requirements pursuant to the Township of West Windsor are as follows:

- Hotel – 1/Room and 0.5/Employee – 208 Required
- Restaurant – 1/3 Seats and 0.5/Employee – 104 Required
- Retail – 5/1000 Square Feet – 80 Required
- Residential – Per Residential Site Improvement Standards (RSIS) – 1,276 Required (692 North – 584 South)
- TOTAL = 1,668 Required

As shown above, 1,668 spaces are required and 1,716 spaces are proposed. Therefore, the parking supply will be more than sufficient to accommodate the maximum anticipated demand.

It is proposed to provide parking stalls with dimensions of 9'x18', which satisfy the Ordinance minimum requirement of 9'x18'. It should be noted that industry standards recommend stall widths of between 8'9" and 9' and a length of 18' for high-turnover land uses such as The Project, which is met as designed.

FINDINGS & CONCLUSIONS

Findings

Based upon the detailed analyses as documented herein, the following findings are noted:

- The proposed mixed use development, will generate 127 entering trips and 220 exiting trips during the weekday morning peak hour and 233 entering trips and 156 exiting trips during the evening peak hour. It should be noted that the “new” weekday morning trips are likely to be lower than that projected since no credit was taken for passby trips.
- Access to the north parcel is proposed via two (2) full –movement driveways along Carnegie Center Drive and one (1) full-movement driveway along Meadow Road.
- Access to the south parcel is proposed via Meadow Road, opposite Meadow Road Connector by creating a new roundabout intersection, as well as via one (1) full-movement driveway along Old Meadow Road.
- With the addition of site generated traffic, all studied intersections are anticipated to operate at acceptable levels of service “D” or better during the peak hours studied.
- As proposed, The Project’s site driveways and internal circulation have been designed to provide for safe and efficient movement of automobiles and large wheel base vehicles.
- The proposed parking supply and design is sufficient to support the projected demand and exceeds the Ordinance requirements.

Conclusions

Based upon our Traffic Impact Study as detailed in the body of this report, it is the professional opinion of Dynamic Traffic LLC that the adjacent street system of the Township of West Windsor, Mercer County and NJDOT will not experience any significant degradation in operating conditions with the construction of The Project. The site driveways are located to provide safe and efficient access to the adjacent roadway system. The site plan as proposed provides for good circulation throughout the site and provides adequate parking to accommodate The Project’s needs.

Intersection Summary

Area Type: Other

Cycle Length: 126

Actuated Cycle Length: 105.4

Control Type: Semi Act-Uncoord

Maximum v/c Ratio: 0.78

Intersection Signal Delay: 15.9

Intersection LOS: B

Intersection Capacity Utilization 91.1%

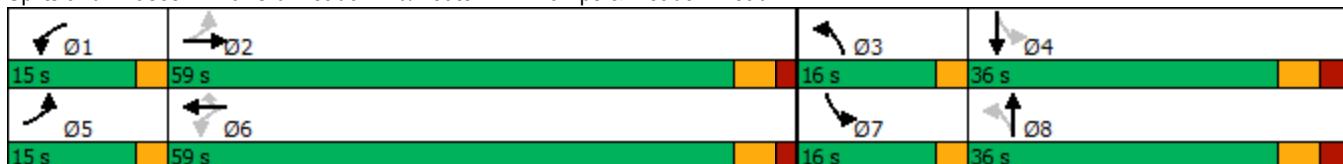

ICU Level of Service F

Analysis Period (min) 15

~ Volume exceeds capacity, queue is theoretically infinite.

Queue shown is maximum after two cycles.
